1. Organization Profile: Atlas Industrial Machinery Group

1.1 Organization Overview

Atlas Industrial Machinery Group (AIMG) is a multinational heavy equipment manufacturing organization that designs, manufactures, and distributes heavy machinery for the construction, mining, infrastructure, and industrial sectors.

AIMG operates across multiple geographic regions and relies on a combination of corporate information technology, cloud services, enterprise applications, manufacturing technology, industrial control systems, and third-party services to support its global business operations.

The organization’s dependence on technology-enabled manufacturing, global supply chains, intellectual property, customer information, and connected operational environments makes cybersecurity a critical component of its enterprise risk management and business resilience strategy.

AIMG therefore maintains a structured cybersecurity governance approach designed to protect business information, manufacturing operations, technology infrastructure, customer data, and critical operational assets while supporting business continuity, regulatory compliance, and secure digital transformation.

1.2 Organization Facts

Category	Assumption
Organization	Atlas Industrial Machinery Group (AIMG)
Industry	Heavy Equipment Manufacturing
Headquarters	USA
Operations	USA, UAE, India, Europe and Asia
Employees	25,000
Manufacturing Plants	12
IT Assets	15,000
OT Assets	5,000
Azure Subscriptions	20
Critical Applications	100
Third-Party Vendors	500
Data Centers	3

SOC	24x7
Environment	Hybrid IT + OT

1.3. Business Structure

- **Corporate Headquarters (USA):** Executive leadership, global finance, corporate governance, strategic decision-making, global R&D, and primary data center operations.
- **Regional Hubs:** UAE, India, Europe, and Asia support regional business operations including sales, engineering, manufacturing, supply chain, regulatory activities, and shared corporate services.
- **Manufacturing Network:** AIMG operates 12 manufacturing plants across its operating regions. Each plant includes production lines, warehousing, engineering workstations, and localized OT environments such as SCADA, ICS, PLCs, robotics, and MES.
- **Shared Services:** Centralized HR, finance, procurement, IT, and other corporate support functions are delivered through designated regional and global shared-service centers.
- **Technology and Security Operations:** Enterprise IT, cloud services, cybersecurity, identity management, security monitoring, vulnerability management, and IT service management support the organization's global business and manufacturing operations.

1.4 Business Functions

Business Function	What it does
Engineering	Designs machinery
Manufacturing	Produces equipment
Supply Chain	Manages materials and suppliers
Procurement	Purchases products/services
Sales	Sells equipment
Finance	Manages financial operations
HR	Manages employees
IT	Provides technology services
Cybersecurity	Protects information and systems
Legal & Compliance	Manages legal/regulatory requirements
Quality	Ensures product quality
Logistics	Manages transportation and delivery

1.5 Technology Environment

IT Environment

organization created for professional portfolio and learning purposes.

AIMG uses:

- Microsoft Azure
- Microsoft Entra ID
- Windows servers
- Linux servers
- Employee endpoints
- Enterprise applications
- Databases
- Network infrastructure
- Microsoft 365
- ServiceNow
- Security monitoring
- Vulnerability management

OT Environment

Manufacturing facilities use:

- PLCs
- SCADA systems
- Industrial control systems
- Manufacturing networks
- Industrial switches
- Sensors
- Production-line equipment
- Engineering workstations

2: Business Context & Criticality

2.1 Critical Business Processes

AIMG depends on several business processes that are essential to its manufacturing, commercial, financial, and corporate operations. These processes are supported by enterprise applications, cloud services, IT infrastructure, and operational technology environments.

The identification of critical business processes provides the foundation for determining business impact, identifying critical assets, assessing cybersecurity risk, and establishing appropriate security priorities.

The following business processes have been identified as critical or high-priority processes for AIMG:

Business Process	Supporting System	Business Owner	Criticality	Business Impact
Manufacturing	MES / OT	VP Manufacturing / Plant Operations	Critical	Production disruption or shutdown, delayed customer orders, financial impact, and potential operational or safety consequences.
Finance	ERP	Chief Financial Officer (CFO)	Critical	Disruption to financial transactions, invoicing, payments, and financial reporting, potentially resulting in financial and compliance impacts.
Supply Chain	ERP	Chief Supply Chain Officer (CSCO)	Critical	Disruption to supplier orders, inventory, procurement, and logistics, potentially causing material shortages, production delays, and customer delivery impacts.
Product Engineering	PLM	VP Engineering / R&D	High	Disruption to engineering activities and product development, with potential impact to intellectual property, project timelines, and competitive position.
Sales	CRM	Chief Sales Officer (CSO)	High	Disruption to customer management, quotations, sales operations, and customer service, potentially resulting in revenue loss and customer dissatisfaction.
Email & Collaboration	Microsoft 365	CIO	High	Loss of corporate communication and collaboration capabilities,

				reducing employee productivity and potentially disrupting business coordination.
IT Service Management	ServiceNow	CIO	High	Disruption to IT incident, request, change, and problem management, potentially slowing recovery from technology incidents and increasing operational downtime.
Human Resources	HR System	Chief Human Resources Officer (CHRO)	Medium	Disruption to payroll, employee services, recruitment, and HR operations, affecting employees and administrative activities while core business operations can generally continue.

The criticality classification is based on the potential business consequences of disruption rather than the technical characteristics of the supporting technology. Business impact, operational dependency, financial consequences, customer impact, regulatory considerations, and potential safety implications are considered when determining process criticality.

2.2 Business Ownership

AIMG assigns business ownership based on organizational accountability for the business process and its associated business outcomes.

The Business Owner is the management role responsible for understanding the objectives, operational requirements, business impact, and risks associated with a business process. Business Owners provide business context to cybersecurity and risk-management activities and participate in decisions concerning risk treatment and business priorities within their delegated authority.

Business ownership is distinct from technical system ownership and cybersecurity responsibilities. Technology and security teams support the business process by operating systems, implementing security requirements, assessing risks, and providing recommendations; however, the business owner remains accountable for the business outcome of the process.

The following business ownership model is established for the identified AIMG business processes:

Business Process	Business Owner	Business Ownership Responsibility
Manufacturing	VP Manufacturing / Plant Operations	Accountable for manufacturing operations, production objectives, operational continuity, and associated business impacts.
Finance	Chief Financial Officer (CFO)	Accountable for financial operations, financial reporting, payments, and associated business impacts.
Supply Chain	Chief Supply Chain Officer (CSCO)	Accountable for supply chain operations, procurement dependencies, inventory availability,

organization created for professional portfolio and learning purposes.

		and supplier-related business impacts.
Product Engineering	VP Engineering / R&D	Accountable for engineering operations, product development, and protection of engineering-related business interests and intellectual property.
Sales	Chief Sales Officer (CSO)	Accountable for sales operations, customer management, revenue-related activities, and customer business impacts.
Email & Collaboration	CIO	Accountable for enterprise IT services supporting communication and collaboration.
IT Service Management	CIO	Accountable for IT service management capabilities and technology service delivery.
Human Resources	Chief Human Resources Officer (CHRO)	Accountable for HR operations, employee services, payroll dependencies, and associated business impacts.

Business Owners are expected to work with cybersecurity, IT, OT, application, legal, compliance, and other relevant stakeholders to ensure that cybersecurity risks are evaluated in the context of business objectives and potential business impact.

2.3 Business Impact

Business impact assessment identifies the potential consequences to AIMG if a critical business process or its supporting technology becomes unavailable, is disrupted, corrupted, or compromised.

The assessment considers the effect on business operations rather than focusing only on technical characteristics. The following impact categories are considered:

- **Financial Impact** – potential revenue loss, increased costs, cash-flow disruption, or other financial consequences.
- **Operational Impact** – disruption or degradation of business operations, production, services, or internal processes.
- **Customer Impact** – disruption to customer service, customer orders, deliveries, or customer experience.
- **Legal/Regulatory Impact** – potential contractual, legal, regulatory, or compliance consequences.
- **Safety Impact** – potential consequences to employee, contractor, customer, equipment, or operational safety.
- **Reputation Impact** – potential loss of customer, supplier, partner, or stakeholder confidence.

Business impact is assessed in consultation with the relevant Business Owner because the Business Owner understands the operational objectives, dependencies, and consequences associated with the business process.

organization created for professional portfolio and learning purposes.

2.3 Business Impact Assessment

Business Process	Financial	Operational	Customer	Legal/Regulatory	Safety	Reputation	Overall Impact
Manufacturing	High	High	High	Medium	High	High	Critical
Finance	High	High	Medium	High	Low	Medium	Critical
Supply Chain	High	High	High	Medium	Medium	High	Critical
Product Engineering	High	High	Medium	Medium	Low	High	High
Sales	High	High	High	Medium	Low	High	High
Email & Collaboration	Medium	High	Medium	Low	Low	Medium	High
IT Service Management	Medium	High	Medium	Medium	Low	Medium	High
Human Resources	Medium	Medium	Low	Medium	Low	Low	Medium

The ratings represent the potential business consequences of disruption and should be validated periodically with the relevant Business Owners. Impact levels may change based on business conditions, regulatory requirements, system dependencies, operational changes, and organizational priorities.

AIMG uses the business impact assessment as an input to determine business criticality, prioritize cybersecurity protection, support risk assessment, and establish appropriate resilience and recovery requirements.

2.4 Crown Jewels

Crown Jewels are the information, applications, systems, technology assets, and operational resources that are considered highly important to AIMG's business operations. The compromise, loss, corruption, or prolonged unavailability of a Crown Jewel could result in significant business impact.

AIMG identifies Crown Jewels by evaluating their relationship to critical business processes, business impact, operational dependency, information sensitivity, and potential consequences to the organization.

The following assets have been identified as initial Crown Jewels for AIMG:

Crown Jewel Asset	Asset Type	Supporting Business Process	Business Owner	Why It Is Critical
MES	Application / OT	Manufacturing	VP Manufacturing / Plant Operations	Supports manufacturing operations and production execution.
Manufacturing OT / ICS Environment	OT Infrastructure	Manufacturing	VP Manufacturing / Plant Operations	Supports industrial control and production operations. Compromise or prolonged unavailability could disrupt manufacturing and create potential safety consequences.
ERP	Application	Finance / Supply Chain	CFO / CSCO	Supports critical financial, procurement, inventory, and supply chain operations.
PLM	Application / Information	Product Engineering	VP Engineering / R&D	Supports product development and manages critical engineering and product lifecycle information.
Engineering Design Repository	Information / Data	Product Engineering	VP Engineering / R&D	Contains critical engineering designs, technical documentation, and intellectual property supporting product development.
CRM	Application / Information	Sales	CSO	Supports customer management, sales operations, opportunities, and customer information.
Microsoft Entra ID	Identity / Security Platform	Enterprise-wide	CIO	Controls enterprise identities and access to critical applications, cloud resources, and corporate services.

Customer & Business Data	Information / Data	Enterprise-wide	Relevant Business Function Owner	Contains sensitive customer and business information requiring protection against unauthorized disclosure, modification, or loss.
-------------------------------------	--------------------	-----------------	----------------------------------	---

Crown Jewel identification is not based solely on the technical importance of an asset. An asset is considered a Crown Jewel when its compromise, loss, corruption, or prolonged unavailability could materially affect an important business process or organizational objective.

Crown Jewels should be reviewed periodically by the relevant Business Owners, IT, OT, application owners, cybersecurity, and other stakeholders to reflect changes in business operations, technology dependencies, regulatory requirements, and organizational priorities.
